

Execution-context disclosure shifts resource and execution-time distributions

Each model configuration's executable blind-reference mean is indexed to 100%; lower values indicate lower observed use or time.

Contract fit (correct + observed MaxRSS within disclosed RAM): 128 MB-aware: Claude 5/5, GPT 5/5, Gemini 2/5; 96 MB-aware: Claude 4/5, GPT 5/5, Gemini 3/5.

Every retained executable observation is visible. The 96 MB samples are independently generated condition-level observations.
